

USB Flash Drives

USB flash drives are a popular way of transferring files, photos and movie clips from one computer to another. They have a greater capacity than a floppy disk and a CD-ROM. While the cost has decreased greatly in recent years, the capacity has increased.

A number of students throughout the school are using USB flash drives as a means of backing up their work and then transferring their files to their home computer to complete.

The school has McAfee antivirus software installed on all computers and students are encouraged to scan for viruses on their flash drive.

There are USB flash drives with different designs, capacity and data transfer rates.
